1.1 Easy-Prime Installation steps

- *Summary*
- *Steps*
 - *Stage 1. Type the installation command*
 - *Stage 2. Type y to start installation*
 - *Stage 3. Waiting for installation, may take 20 min*
 - *Stage 4. Installation is completed*
 - *Stage 5. Print Easy_prime help message*
- *FAQ*
 - *Can Easy-Prime be installed in Windows?*
 - *Can Easy-Prime be installed via lower conda version?*

1.1.1 Summary

Installation of Easy-Prime is really easy via conda, however, you might experience errors due to lower conda version problem. Please make sure that you have conda installed and conda version ≥ 4.9 .

Note: Easy-Prime is only available on Linux or Mac. For installation via conda, make sure conda version ≥ 4.9 .

1.1.2 Steps

The installation may take 20 min.

Stage 1. Type the installation command

```
conda create -n easy_prime -c cheng_lab easy_prime
```

Please note that `-n ENV_NAME`, the `ENV_NAME` can be anything strings without space. `-c cheng_lab easy_prime` means installation the compiled conda package (namely `easy_prime`) from `cheng_lab` channel.

```
[yl11@noderome176 ~]$ conda create -n easy_prime -c cheng_lab easy_prime
Collecting package metadata (current_repodata.json): done
Solving environment: done

==> WARNING: A newer version of conda exists. <==
  current version: 4.9.2
  latest version: 4.10.1

Please update conda by running

  $ conda update -n base -c defaults conda

## Package Plan ##

environment location: /home/yl11/.conda/envs/easy_prime

added / updated specs:
  - easy_prime
```

Stage 2. Type y to start installation

Once you have typed in the `conda create` command, the conda program will start to gather information, for example, informing you about new conda version. Then it tells you a “Package Plan”, for new packages to be downloaded and installed.

The following packages will be downloaded:

package	build		
biopython-1.78	py37h5e8e339_2	2.6 MB	conda-forge
brotli-python-1.0.9	py37hcd2ae1e_4	352 KB	conda-forge

    jupyter nbextension enable jupyter_dashboards --py --sys-prefix

Enabling notebook extension jupyter_dashboards/notebook/main...
- Validating: OK

do
ne
#
# To activate this environment, use
#
#     $ conda activate easy_prime
#
# To deactivate an active environment, use
#
#     $ conda deactivate
#

[yilil@nodeome176 ~]$

```

The terminal says, “To activate, use conda activate easy_prime”.

To use conda activate or source activate depends on the operating system. In Mac and Linux, please use source activate easy_prime.

Stage 5. Print Easy_prime help message

```
# To activate this environment, use
#
#   $ conda activate easy_prime
#
# To deactivate an active environment, use
#
#   $ conda deactivate

[yl11@noderome176 ~]$ source activate easy_prime
(easy_prime) [yl11@noderome176 ~]$ easy_prime -h
usage: easy_prime [-h] -f VCF_FILE [-c CONFIG] [-v VERSION] [-o OUTPUT]

easy_prime for pegRNA design

optional arguments:
  -h, --help            show this help message and exit
  -f VCF_FILE, --vcf_file VCF_FILE
                        input target mutations to look for pegRNAs (default:
                        None)
  -c CONFIG, --config CONFIG
                        A YAML file specifying parameters (default: None)
  -v VERSION, --version VERSION
                        print version (default: 1.1.3)
  -o OUTPUT, --output OUTPUT
                        output dir (default:
                        easy_prime_yl11_2021-05-14_result_dir)
(easy_prime) [yl11@noderome176 ~]$
```

Type, `easy_prime -h`

1.1.3 FAQ

Can Easy-Prime be installed in Windows?

No. It is currently impossible because the ViennaRNA package is not available in Windows. We might develop a Docker version for Easy-Prime in the future so that users in any OS can use Easy-Prime.

Can Easy-Prime be installed via lower conda version?

Yes. It is possible but can be time-consuming. You can install the following dependencies via conda (some may still need higher conda version) and then install Easy-Prime via `pip install easy-prime`.

```
- python
- bedtools
- matplotlib
- pandas
- xgboost
- scikit-learn
- viennarna
```

(continues on next page)

(continued from previous page)

```
- joblib
- pyyaml
- scikit-bio
- biopython
- mechanize
- dna_features_viewer
- dash
- dash-bio
- dash-core-components
- jupyter_dashboards
- plotly
```

1.2 Easy-Prime Web server tutorial

- *Welcome to Easy-Prime*
- *Get Started*
- *Input formats*
 - *VCF format*
 - *FASTA format*
 - *PrimeDesign format*
- *Searching Parameters*
- *Output pegRNA/ngRNA design tables*
- *Output pegRNA/ngRNA genome browser visualization*

1.2.1 Welcome to Easy-Prime

Easy-Prime is a machine learning based tool for prime editing gRNA (pegRNA) design. Please input your desired edits in VCF format or FASTA format and click start. Additionally, you can play with the pegRNA/ngRNA searching parameters. Outputs include a bed-like table and genome-browser visualization.

This web server is based on Dash. URL is: <http://easy-prime.cc/>

Note: Currently, this web portal only supports hg19.

Note: We had it before that the Easy-Prime server is down due to some AWS issue. If so, just let us know, we will fix it.

1.2.2 Get Started

Go to the easy-prime web portal, the webpage looks like below:

The screenshot shows the Easy-Prime v1.2 web portal. Red arrows point to various features:

- Input your desired edit here:** Points to the input fields for Chromosome, Position, Variant ID, Reference allele, and Alternative allele.
- Click here to check status:** Points to the 'CHECK RUNNING STATUS' button.
- Choose search parameters, such as RTT length:** Points to the 'Reverse Transcription Template length' slider.
- To start easy-prime, click "START":** Points to the 'START' button.
- Load input examples for the 4 acceptable formats:** Points to the 'EXAMPLES' button.

The interface includes a 'Step 1. Select the input format below.' section with buttons for VCF, VCF batch, FASTA, and PrimeDesign. A 'Design Tables (Easy-Prime Output)' section shows a table with columns: chr, start, end, seq, DeepSpCas9_score, strand, target_pos, and annotation. A 'Design Visualizations' section is at the bottom.

Here, you can find areas to input target mutations, to choose different searching parameters, and output visualizations, including a bed-like table and a genome-browser visualization.

For starter, you can first click **Examples** to automatically load input examples for the 4 acceptable formats.

If you experience error (very likely due to incorrect input format), you can click the **check running status** button for error messages. Note that it may not be able to capture all kinds of errors.

Note: If you do experience error and everything seems not working, please refresh the browser and start over. If the issue is still there, please email us.

1.2.3 Input formats

The program accepts 4 types of formats. The first two are VCF-like formats. Basically we need 5 types of information, which are: chr, pos, ID, ref, alt, specified in the first 5 columns in a vcf file.

VCF

VCF batch

FASTA

PrimeDesign

Chromosome:

chr1

Position:

158582552

Variant ID:

rs2251964

Reference allele:

G

Alternative allele:

A

VCF

VCF batch

FASTA

PrimeDesign

```
## comment line, will be ignored
chr9 110184636 FIG5G_HEK293T_HEK3_6XHIS G GCACCATCATCACCATCAT
chr1 185056772 FIG5E_U2OS_RNF2_1CG G C
chr1 173878832 rs5878 T C
chr11 22647331 FIG3C_FANCF_7AC_PE3B T G
chr19 10244324 EDFIG5B_DNMT1_dPAM G T
```

VCF

VCF batch

FASTA

PrimeDesign

VCF

VCF batch

FASTA

PrimeDesign

The last two are fasta-like formats. Basically users can input DNA sequences and the program will automatically determine the target mutation and optimize pegRNA/ngRNA design.

VCF format

chr19 10244324 EDFIG5B_DNMT1_dPAM G T
```

The VCF tab is used for single target mutation and the VCF batch tab is used for any number of target mutations (prefer less than 10 mutations). The server prohibits output file size > 50M. If you want to design pegRNAs for large number of mutations, please download the command line program.

Note that this format is a tsv format, please do not confuse the program with space or comma. You can first create the input in excel and then copy and paste it to the text box.

FASTA format

```
>rs2251964_ref
GTTACCAAAGCAAATGACATCTTGTGAAAGGGGAGGTCTGAAAAAACAAGTGGGTGGGTTTTTCAAAGTAGGCCACCGGGCCTGAGATGACCAGAATT
>rs2251964_alt
GTTACCAAAGCAAATGACATCTTGTGAAAGGGGAGGTCTGAAAAAACAAGTGGGTGGGTTTTTCAAAGTAGGCCACCGGGCCTGAGATAACCAGAATT
```

We use a keyword to recognize the reference and mutated sequences and they are _ref and _alt. In this example, variant name is rs2251964, but it can be string without spaces.

We suggest the input sequence length is at least 100bp.

PrimeDesign format

```
>test_SNV
GCCTGTGACTAACTGCGCCAAAACGGCCTGTGACTAACTGCGCCAGCCTGTGACTAACTGCGCCAAAACGAAACG(T/
↪A)GCCTGGCCTGTGACTAACTGCGCCAAAACGTGACTAACTGCGCCAAAACGCTTCCAATCCCCTTATCCAATTTA
>test_insertion
GCCTGTGCCTGTGACTAACTGCGCCAAAACGGAGCCTGTGACTAACTGCGCCAAAACGCTAACTGCGCCAAAACGT(+CTT)CTTCCGCTGGCCTGTGACTA
>test_deletion
GCCTGTGACTAGCCTGTGACTAACTGCGCCAAAACGACTGCGCGCCTGTGACTAACTGCGCCAAAACGCAAAAC(-
↪GTCT)TCCAATCGCCTGTGACTAACTGCGCCAAAACGCCCTTATCCGCTGTGACTAACTGCGCCAAAACGAATTTA
```

Please see <https://github.com/pinellolab/PrimeDesign#primedesign-input-sequence-format> for more information.

We use PrimeDesign format as a FASTA format, the fasta header is used as the variant name.

Please note that the Combinatorial edits format is not supported, e.g., GC(G/T)CCA(+ATCG)AAA

1.2.4 Searching Parameters

Here users can change RTT length, PBS length, and nick-gRNA distance. We suggest users just use the default settings.

1.2.5 Output pegRNA/ngRNA design tables

Once easy-prime is finished, default sgRNA, PBS, RTT, ngRNA selection is set to be the one with the highest predicted editing efficiency.

Users can click on each tab (e.g., PBS table tab) to choose other sequences. Selection of sgRNA triggers updates of PBS, RTT, and ngRNA table, since there 3 components are unique for each sgRNA. Each selection triggers the genome browser visualization in the bottom.

To download all results for current Easy-Prime prediction, click the **Download all prediction** button. This will download all prediction in a bed-like format as a zip file. Remember that Easy-Prime exhaustively searches all combinations, this is a big file.

To download your current selection, click “Download current selection”. This is a bed-like format containing the 4 components of a pegRNA/ngRNA, which are sgRNA, PBS, RTT, and ngRNA.

Easy-Prime v1.2

Step 1. Select the input format below. **Click to choose a sequence.**

VCF VCF_batch FASTA PrimeDesign

Chromosome: chr1
Position: 158582552
Variant ID: rs2251964
Reference allele: G
Alternative allele: A

Design Tables (Easy-Prime Output)

Design Visualizations

rs2251964_8_14_18_78 **Tab label means: [variant_id]_[target_pos]_[PBS_length]_[RTT_length]_[nick_position]**

Genome browser view

ID: rs2251964, CHR: chr1, POS: 158582552, REF: G, ALT: A
Predicted efficiency: 18.0%

Same visualization, good when user inputs custom sequence

1.2.6 Output pegRNA/ngRNA genome browser visualization

Genome browser view is powered by Protein Paint (<https://pecan.stjude.cloud/proteinpaint>). You can zoom in to actually see the DNA bases.

However, we only support hg19 in the tracks. So then the second visualization, will be better if your input is in FASTA format (e.g., if you have hg38 variant, you can first extract +/- 100bp sequence and input here).

1.3 Ask questions here

https://github.com/YichaoOU/easy_prime

1.4 Summary

PE design involves carefully choosing a standard sgRNA, a RT template that contains the desired edits, a PBS that primes the RT reaction, and a ngRNA that nicks the non-edit strand. Usually thousands of combinations are available for one single desired edit. Therefore, it is overwhelming to select the most likely high-efficient candidate from the huge number of combinations.

Easy-Prime applies a machine learning model (i.e., XGboost) that learned important PE design features from public PE amplicon sequencing data to help researchers selecting the best candidate.

1.5 Installation

```
conda create -n genome_editing -c cheng_lab easy_prime

source activate genome_editing

easy_prime -h
```

For detailed installation with screenshots, see: [Installation](#)

1.6 Input

1. vcf input example

VCF headers will be ignored. Only the first 5 columns from the vcf file will be used; they are: chr, pos, name/id, ref, alt.

```
## comment line, will be ignored
chr9    110184636    FIG5G_HEK293T_HEK3_6XHIS    G    GCACCATCATCACCATCAT
chr1    185056772    FIG5E_U2OS_RNF2_1CG    G    C
chr1    173878832    rs5878    T    C
chr11   22647331    FIG3C_FANCF_7AC_PE3B    T    G
chr19   10244324    EDFIG5B_DNMT1_dPAM    G    T
```

2. fasta input example

To specify reference and alternative allele, you need two fasta sequences; *_ref* is a keyword that will be recognized as the reference allele and *_alt* is a keyword for target mutations.

```
>test_ref
AAAAAAAAAAAAAAAAAAAAAAAAAGGAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAA
>test_alt
AAAAAAAAAAAAAAAAAAAAAAAAAGGAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAA
```

1.7 Config file

Default values are shown in the following yaml files.

```
genome_fasta: /path/to/genome.fa
scaffold: GTTTTAGAGCTAGAAATAGCAAGTTAAAATAAGGCTAGTCCGTTATCAACTTGAAAAAGTGGCACCGAGTCGGTGC
debug: 0
n_jobs: 4
min_PBS_length: 8
max_PBS_length: 17
min_RTT_length: 10
max_RTT_length: 25
min_distance_RTT5: 3
max_ngRNA_distance: 100
max_target_to_sgRNA: 10
sgRNA_length: 20
offset: -3
PAM: NGG
```

1.8 Output

The output folder contains:

- topX_pegRNAs.csv
- rawX_pegRNAs.csv.gz
- X_p_pegRNAs.csv.gz
- summary.csv

The top candidates are provided in *topX_pegRNAs.csv*. This is a rawX format file.

RAWX FORMAT

X means the input to machine learning models. Here, rawX basically means the file before machine learning featurization. Specifically, rawX contains 11 + 1 columns. The first 5 columns are from the input vcf file: sample_ID, chr, pos, ref, alt, where sample_ID ends with *_candidate_xxx*, this indicates the N-th combination. The next 6 columns are genomic coordinates: type, seq, chr, start, end, strand, where the *type* could be sgRNA, PBS, RTT, or ngRNA. Since for one PE design, it has to have these 4 components, which means that for one unique *sample_ID*, it has 4 rows specifying the sequences for each of them. The 12-th column, which is optional, is the predicted efficiency; in other words, the Y for machine learning.

Both *topX_pegRNAs.csv* and *rawX_pegRNAs.csv.gz* use this format.

X FORMAT

X format is the numeric representation of rawX. X_p format appends the predicted efficiency to the last column of X.

MAIN RESULTS

The main results, which is the top candidates, is provided in *topX_pegRNAs.csv*.

PE DESIGN VISUALIZATION

Users can visualize the predicted combinations using:

```
easy_prime_vis -f topX_pegRNAs.csv -s /path/to/genome_fasta.fa
```

This will output pdf files to a result dir.

5.1 Usage

```
git clone https://github.com/YichaoOU/easy_prime
cd easy_prime/test
easy_prime -h
easy_prime --version

## Please update the genome_fasta in config.yaml

easy_prime -c config.yaml -f test.vcf

## Will output results to a folder
```

DASH APPLICATION

Easy-Prime also provides a dash application.

Please have dash installed before running the dash application.

```
git clone https://github.com/YichaoOU/easy_prime  
  
cd easy_prime/dash_app  
  
python main.py
```
